Name: Hsiu-yuan Yang   AndrewID: hsiuyuay
Name: Ankit Kumar   AndrewID: ankitkum
Name: Jahnvi Gupta   AndrewID: jahnvig

Step 1: Install packages
We use pandas, matplotlib, urllib, NumPy, beautifulsoup4, and requests in our codes. If you have Python and these installed, skip to Step 2.

If you don't have Python, install Anaconda. The packages should be pre-installed with Anaconda. You can use

```
conda list
```

to double-check that you have these packages installed. If you have any of these packages missing, install the missing package(s) using the following command.

```
conda install <package_name>
```

Or if you prefer pip, in your terminal of choice:

```
pip install <package_name>
```

Step 2: Run the program
Our main program is called **app.py**.
If you use a terminal, change directory to where our source files are and type in

```
python app.py
```

If you use an IDE, change directory and run **app.py**
